There are risks involved with mutual fund investing, including the risk of loss of principal. There is no assurance that the investment process will consistently lead to successful results. Investing in fixed income securities such as bonds involves interest rate risk. When interest rates rise, the value of fixed income securities generally decreases. High-yield bonds involve a greater risk of default and price volatility than U.S. Government and other higher-quality bonds. An investment concentrated in sectors and industries may involve greater risk and volatility than a more diversified investment. There are risks associated with small- and mid-cap investing such as less liquidity, limited product lines, and small market share. Value investing involves risks and uncertainties and does not guarantee better performance or lower costs than other investment methodologies.

Investments in foreign securities involve different risks than U.S. investments, including fluctuations in currency exchange rates, potentially unstable political and economic structures, less efficient trade settlement practices, reduced availability of public information, and lack of uniform financial reporting and regulatory practices similar to those that apply to U.S. issuers. Foreign stock markets may also be less liquid and more volatile than U.S. stock markets. Additionally, global natural resources may be affected by supply and demand and price fluctuations caused by inflationary trends. Investing in developing and emerging markets can be volatile as those markets may be highly vulnerable to local and global changes including risks of taxation, expropriation, and restrictions on withdrawal of assets.

The Fund intends to distribute net investment income and net capital gains, if any, on an annual basis generally each December. From time to time, the Fund may make additional distributions.

ICON's value-based investing model is an analytical, quantitative approach to investing that employs various factors, including projected earnings growth estimates, in an effort to determine whether securities are over- or underpriced relative to ICON's estimates of their intrinsic value. ICON's value approach involves forward-looking statements and assumptions based on judgments and projections that are not guarantees of future results.

The S&P North American Natural Resources Sector Index is a benchmark that tracks the performance of publicly traded large and mid-cap US and Canadian companies in the natural resources and commodities businesses, specifically within the energy, metals & mining, and agriculture sub-industries.

\*As of 12/31/25 the ICON Natural Resources and Infrastructure Fund, Institutional Class, was rated against the following numbers of U.S. Natural Resources Funds over the following time periods: 113 funds in the last three years, 104 funds in the last five years, and 92 funds in the last ten years. With respect to these U.S. Natural Resources funds, the ICON Natural Resources and Infrastructure Fund, Institutional Class, received an overall Morningstar Rating of 4 stars, with 4 stars for the three-, five-, and ten-year periods. Morningstar Rating is for the Institutional Class shares only; other classes may have different performance characteristics.

The beta coefficient is a measure of a portfolio's volatility relative to the market. An index relevant to the portfolio is used as the proxy for the market, and is considered to have a 1.00 beta. Therefore, if the portfolio has a beta of 1.50, it has historically been 50% more volatile than the market for the periods shown. The alpha coefficient is a measure of risk-adjusted return relative to a specific benchmark. This number represents the difference between the portfolio's actual performance and the performance anticipated in light of the portfolio's risk posture and the market's behavior as represented by the benchmark. A positive alpha indicates that the manager has been successful at security selection and has produced a rate of return which is more than commensurate with the portfolio's risk posture as it relates to the underlying benchmark. The Sharpe Ratio is a measure of risk-adjusted performance calculated by dividing a portfolio's excess return above a "risk-free" rate by its standard deviation. The U.S. Treasury Bill-3 month returns are used as the risk-free rate. Standard deviation is a measure of a portfolio's volatility, or variability, in expected return. As such, it is a measure of risk since risk can be defined as the uncertainty of the expected return. Higher numbers indicated higher historical volatility. Standard deviation is most often used as a measure of risk relative to other portfolios or indexes, although it does not measure all aspects of investment risk. The Upside Capture percentage explains how well a portfolio performs in monthly periods where the benchmark returns are greater than 0.00%. For example, if the benchmark's upside capture is 100% and the portfolio's is 117%, then when the benchmark is up 10%, the portfolio would be up 17%. The Downside Capture percentage explains how well a portfolio performs in monthly periods where the benchmark returns are less than 0.00%. For example, if the benchmark's downside capture is 100% and the portfolio's is 96%, then when the benchmark is down 10%, the portfolio would be down 9.6%.

Neither Morningstar nor its content providers are responsible for any damages or losses arising from any use of this information.

Morningstar Rating is for the Institutional Class shares only; other classes may have different performance characteristics. The Morningstar Rating™ for funds, or "star rating", is calculated for managed products (including mutual funds, variable annuity and variable life subaccounts, exchange-traded funds, closed-end funds, and separate accounts with at least a three-year history). Exchange-traded funds and open-ended mutual funds are considered a single population for comparative purposes. It is calculated based on a Morningstar Risk-Adjusted Return measure that accounts for variation in a managed product's monthly excess performance, placing more emphasis on downward variations and rewarding consistent performance. The top 10% of products in each product category receive 5 stars, the next 22.5% receive 4 stars, the next 35% receive 3 stars, the next 22.5% receive 2 stars, and the bottom 10% receive 1 star. The Overall Morningstar Rating for a managed product is derived from a weighted average of the performance figures associated with its three-, five-, and 10-year (if applicable) Morningstar Rating metrics. The weights are: 100% three-year rating for 36-59 months of total return, 60% five-year rating/40% three-year rating for 60-119 months of total returns, and 50% 10-year rating/30% five-year rating/20% three-year rating for 120 or more months of total return. While the 10-year overall star rating formula seems to give the most weight to the 10-year period, the most recent three-year period actually has the greatest impact because it is included in all three rating periods. Ratings do not take into account the effects of sales charges and loads.

Natural-resources portfolios focus on commodity-based industries such as energy, chemicals, minerals, and forest products in the United States or outside of the United States. Some portfolios invest across this spectrum to offer broad natural-resources exposure. Others concentrate heavily or even exclusively in specific industries. Portfolios that concentrate primarily in energy-related industries are part of the equity energy category.
